

Or Pusher Station as it also use to be called, is a purely mechanical device meant for booklets, brochures, books etc. that cannot be processed in the rotary feeders in a good way. Mostly for products with a square back and products with stitched backs that exceeds the max. thickness for a rotary feeder.

The station is designed so that it will fit into one standard position over the racetrack, and the standard settings for a rotary station may then be used. Due to this, the Pusher station may replace any other rotary feeder, regardless of position. However we recommend having an empty section in front of the pusher station for more space putting the product down to the racetrack. For thin and glossy product, the station is foreseen with vacuum for ease of separation.

SPECIFICATIONS:

Min. size product:	90 x 205 mm
Max. size product:	215 x 310 mm
Thickness:	Max. 12 mm Min. 2 mm
Speed:	Up to 8.000 cycles/hour depending of thickness and material.
